PlayStation 4 specifications Contents Hardware

The PlayStation 4's hardware specifications are: CPU: A new, energy-efficient x86 processor based on the zEN™ architecture, featuring four cores and eight threads and an advanced, unified memory controller. It features 8 MB of unified system memory, with an additional 8 MB of high-speed GDDR5 video memory, and an 8 MB portion of unified system memory that is accessible by the game engine. GPU: A next-generation, fully programmable GPU that is capable of delivering up to 1.84 teraflops of graphics performance using the custom Brinck GPU base architecture. The Brinck GPU is based on the teraflops-class Brinck "XGPU" technology, which is a custom NVidia GPU core developed specifically for the PS4, and is what provides for the console's high graphical fidelity and performance.

Memory: The PS4 software architecture is engineered to be "eager for content" and "eager for use," making it easy to upgrade the system's memory when additional capacity is needed. The PS4 includes an asymmetric memory architecture that gives both DDR3 RAM memory and GDDR5 VRAM memory, each located in its own separate packages, giving developers the ability to choose which type of memory is used for a specific application. A design that provides for a maximum of 1 TB of system memory.

Networking: The PS4 supports networks with up to 8 Gigabit Ethernet ports. The system supports backward compatibility with Wi-Fi and Bluetooth® 2.1+EDR 802.11n wireless network adapters. The PS4 provides an Ethernet port, VGA port, game controller and power connector.
